EVER AFTER

Once upon a time, this 10 acre area in St. Louis was home to hundreds of happy pigeons. With the water feature, trees, restaurants, open areas and trussing above, it was the perfect area for birds to eat, play, and roost. Unfortunately for humans, it was virtually covered with bird droppings. Even the leaves on the trees were “bird dropping” white.

Then came 2 Bird Buffers and voila! The birds found another place to live and roost. The humans now enjoy clean tables free of droppings, sparkling clean leaves on the plants and trees, and walking under the truss without worries of bird poop coming down. The business owners enjoy not having to constantly clean the poop off their property. And they lived happily.....

Can you find the Bird Buffers? The Bird Buffers were placed so that the wind assisted in bringing the vapor from the outer buildings toward infested areas. One is sitting above the Landry's sign on the pink truss

(page 1) and the other is located on the pink truss (page 2 below) .That's right! They had the machine's cover painted pink to match in with the environment.

The vapor from the Bird Buffer stays airborne and travels much further than any other spray system on just one gallon of fluid per month. In comparison, other spray systems use 12 nozzles for up to 12 gallons a month in smaller areas than this, saturating areas with visible spray, and potentially causing a residue build up on property.

Because the air is separated internally with a patented process that vaporizes and separates at the

same time, the Bird Buffer vapor is a light, pleasant scent that is virtually invisible.

In this installation, the air movement and location of the Bird Buffers® were determined with aerosol cans of Windicator™ haze. Once sprayed into the air, the motion of air is visible and knowing where to place the units will be a breeze (no pun intended)! Contact us today for your “happily ever after.”
