

Bird Buffer® Keeps Lear Jets Clean with Bird Control!

Cleaning Lear Jets from bird droppings and keeping them clean was a challenge for Pat's Aircraft facility in Delaware. The birds basically made the hangar, their home. After trying several remedies, they found the Bird Buffer manufactured by GBS.

With one Bird Buffer® and an 18" long tube for even distribution throughout the entire hangar, Pat's was able to obtain the perfect solution for their problem. "We would watch the birds come in and fly right back out. We have had such good response that we've turned down the output to be much more energy efficient."

Installation was fairly straight forward. The air-flow from the tube is tremendous, covering 200' wide by 400' long from one machine. This is the best and driest method of clean and natural bird control that doesn't harm the birds. It just makes them go away.
